Synthetic Lubrication 3605

A highly effective general lubricant with added PTFE, which is excellently suited for use in cold conditions and has a high thermal stability (-55°C – +250°C) due to the synthetic base oils. The low surface tension enables effective penetration into microscopic spaces. Lubricates effectively and reduces wear on moving components caused by friction. The oil film repels moisture due to its waxy solid compounds and creates a lubricating coating that provides effective protection. The combination of an extreme pressure additive and PTFE ensures proper lubrication in even the most challenging conditions. Applications: Locks, valves, guides, sliding surfaces, conveyors, rollers, roller skates, guide rails, rigging, tools, etc.
